COMMISSION STAFF WORKING DOCUMENT

STATISTICAL ANNEX

Accompanying the document

**REPORT FROM THE COMMISSION TO THE EUROPEAN PARLIAMENT, THE
COUNCIL, THE EUROPEAN CENTRAL BANK AND THE EUROPEAN
ECONOMIC AND SOCIAL COMMITTEE**

Alert Mechanism Report 2014

**(prepared in accordance with Articles 3 and 4 of Regulation (EU) No 1176/2011 on the
prevention and correction of macroeconomic imbalances**

{ COM(2013) 790 final }

{ SWD(2013) 790 final }

Introduction

European Union economic policy frameworks rely more than ever on timely and high quality socio-economic statistics. The rapid development of EU economic governance along with the growing statistical needs represent a major challenge for the European Statistical System.

In the field of Macroeconomic Imbalances Procedure, the ESS has taken a number of initiatives to enhance the standards and methods used for the compilation of underlying data as well as to strengthen the quality assurance framework. Significant progress has been achieved since the publication of the Alert Report Mechanism 2013. The results of several improvement actions have been incorporated in the statistics presented in the 121 tables grouped by headline and auxiliary indicators in this Statistical Annex.

The scoreboard data are primarily derived from data compiled by the European Statistical System (ESS) and the European System of Central Banks (ESCB).

The MIP Scoreboard consists of eleven headline indicators covering the major sources of macroeconomic imbalances:

- 3 year backward moving average of the current account balance in % of GDP
- net international investment position in % of GDP
- 3 years percentage change of the real effective exchange rate (42 industrial countries) based on HICP/CPI deflators
- 5 years percentage change of export market share (share of world exports)
- 3 years percentage change in nominal unit labour cost.
- year-on-year change in deflated¹ house prices
- private sector credit flow in % of GDP
- private sector debt in % of GDP
- general government sector debt in % of GDP
- 3 year backward moving average of unemployment rate
- year-on-year change of total financial sector liabilities

Supplementing the headline indicators, a list of 28 auxiliary indicators provides additional information on aspects linked to the general macroeconomic situation, nominal and real convergence inside and outside the EU and the euro area, and detailed data on the external liabilities, including foreign direct investment and net external debt. They also enhance the information base for understanding potential imbalances, as well as the adjustment capacity of the economy. Additionally, to allow a better understanding of the risks and to help identifying relevant policy measures, eight additional indicators on social issues have been added to the list of auxiliary indicators used for the economic reading. The auxiliary indicators developments are presented in chapters 2 and 5.

The cut-off date for the data in this document was **1 November 2013**.

¹ Final consumption expenditure of households and non-profit institutions serving households deflator

Changes to the statistical methodology and underlying data

In order to ensure that the scoreboard can adapt to future macroeconomic challenges and can profit from better statistical information, the composition of the scoreboard indicators may evolve over time.

Compared to the AMR 2013, the definition of three headline indicators has been modified to take account of better statistical information: the real effective exchange rate, private sector credit flow and private sector debt. The changes are discussed in detail below. Furthermore, the underlying data used for the headline indicator on house price developments is now based on a harmonised methodology following the adoption of Regulation (EC) 93/2013.

External imbalances

As regards **Balance of Payments** statistics, the most significant improvements come from the bilateral exchange between Member States of data on Foreign Direct Investment (FDI) positions and transactions. This aims to harmonise and improve statistics on FDI, and it is particularly important from the perspective of data analysis and quality assessment of the headline indicator on net international investment position.

Concerning **Real Effective Exchange Rate (REER)** up until the current MIP exercise, the indicator was computed against a panel of 35² other trading partners. By adding Croatia, as a new Member State, to the basket and improving the coverage to include China, Brazil, Russia, South Korea and Hong-Kong, the number of trading partners of each Member State has been extended to 41. This allows better accounting for the increasing role of some emerging economies when measuring competitiveness. The Commission will consider extending the basket of trading partners further when data of sufficient quality for additional emerging countries become available.

Internal imbalances

Among the statistical gaps highlighted by the financial and economic crisis, real estate price statistics was considered one of the areas to be urgently developed. Particular attention has been devoted to developing internationally comparable **House Price Indices (HPI)**. At the beginning of 2013, with the entering into force of the reference legislation³, the monitoring of changes in house prices is now based on data regularly compiled by Member States and transmitted to Eurostat.

Compared with other indicators, HPIs have shorter historical coverage, for some Member States the series only start in 2009. The European Commission, ECB, OECD, and BIS continue to work on backward data calculation aiming at increasing the length of back series by using all available data. To strengthen the knowledge base of the use and compilation of HPIs globally, Eurostat has been leading the drafting of an international handbook on residential property price indices. The handbook was officially released in April 2013. Finally to enhance the relevance of HPI and its economic reading, Eurostat works on the metadata on housing statistics which will be published by the end of 2013.

In the field of government finance statistics Eurostat continues to implement its strengthened verification procedures. An inventory of Excessive Deficit Procedure (EDP) processes, which includes a public commitment on the quality of EDP statistics, was made public in January 2013. Eurostat checks the application of general methodological rules and its methodological

² EU27 countries plus Australia, Canada, United States, Japan, Norway, New Zealand, Mexico, Switzerland, and Turkey

³ Commission Regulation (EU) 93/2013 as regards establishing owner-occupied housing price indices

decisions related to the **general government sector debt** by analysing the data reported by Member States in the EDP notification tables, questionnaire related to the notification tables, supplementary tables on financial crisis, as well as through discussions with national authorities during EDP standard dialogue visits. In addition to that, Member States may ask Eurostat to provide formal advice on specific cases.

The **debt of the non-financial private sectors** (non-financial corporations, households and non-profit institutions serving households) can be measured in consolidated or non-consolidated terms. Consolidated debt corresponds, by and large, to the amount of funds that the sector receives from other sectors. Non-consolidated debt gives the total gross indebtedness of the sector, including debts between two entities of the same sector. The issue of consolidation is highly relevant in the non-financial corporations (NFC) sector whereas its effect in the household sector is negligible.

From an economic point of view, there is a fundamental difference between intra-group loans and loans contracted by two independent companies. Intra-groups loans do not constitute an imbalance, they merely reflect institutional, corporate financing, accounting and tax practices. In contrast, loans between two independent companies could signal deficiencies in the financial intermediation role of the financial sector, generating fragility in the NFC sector.

Since consolidated data of non-financial corporations were not available for all Member States at the time of the first release of the MIP Scoreboard, non-consolidated data were used, although consolidated data were considered preferable. To address this issue and to develop further practical guidelines on statistical consolidation of data, a technical Task Force was set up. The result of the significant efforts by Eurostat, statistical institutes and central banks in Member States, is that all Member States now produce consolidated financial data.

Based on conceptual (economic) and statistical considerations, the use of consolidated data is both analytically sounder and statistically more robust. Non-consolidated data will, nevertheless, continue to be used as an additional indicator for the economic reading of the scoreboard.

At the same time, it was proposed to exclude financial derivatives from the definition of the private sector debt since it would allow for a clearer economic interpretation of scoreboard indicator. Private sector debt in the scoreboard has been defined as the sum of loans and securities other than shares, including financial derivatives. Removing derivatives from the definition improves the comparability of data among the EU Member States. In fact, the aim of this indicator is to capture liabilities contracted as funding sources, while derivatives are mostly used for either (short-term) hedging or speculation. This item accounts for a very small part of the private sector liabilities, and their exclusion would not have any practical consequence of the MIP implementation.

Quality issues relating to the MIP indicators

Overall, most of the MIP relevant data are produced in statistical frameworks or domains (National Accounts, Balance of Payments, Labour Market Statistics, etc.) with a long track record and well-known quality profiles. As regards the interpretation of the MIP indicators and the related data, it should be noted that

- some issues related to the house price indicator are flagged in the relevant tables;
- in the area of Financial Accounts and Balance of Payments, new and better information frequently leads to revisions of historical data. This concerns especially the stock indicators (private debt and net international investment positions),

- some historical data for Croatia may not be fully comparable with data from other Member States;

Improving the quality framework

In order to ensure that the political decision process and the implementation monitoring are successful, it is essential that the statistical information is relevant and fit for the purpose. For that reason, the scoreboard indicators are regularly reviewed and the underlying statistical methodology is constantly improved.

To enhance the quality framework for the MIP statistics and in response to the request of the ECOFIN Councils of 8 November 2011 and 13 November 2012, the Commission adopted on 7 June 2013 a proposal for a Regulation of the European Parliament and of the Council on the provision and quality of statistics for the macroeconomic imbalances procedure (COM(2013) 342 final). This draft Regulation aims to ensure the statistical monitoring of MIP relevant data by Eurostat as well as issues linked to compilation and transmission of data and metadata by Member States, monitoring of data quality by Eurostat, reporting/communication to the different stakeholders and to the European Parliament and the Council.

The draft Regulation itself sets out the general principles of the statistical quality monitoring system. At the same time, Eurostat is developing in detail the ways in which the statistical monitoring framework could be applied (quality assessment, inventories of data sources and methods, quality reports by Member States, missions to Member States, specific controls, actors involved, assessment reports, etc.). This will be based on a thorough analysis of existing regulations and frameworks. In particular, a systematic assessment of procedures, inventories of sources and methods, statistical quality reports, and, not least, the data provided will identify the statistical domains for which the adherence with the principles laid down in the European Statistics Code of Practice need further examination. At the same time, the analysis should identify means to streamline requirements and practices, to avoid duplications, enhance synergies, and limit burden.

Ongoing improvement of the underlying statistical information

In parallel with the discussions on a general quality framework, the statistical systems (ESS and ESCB) continue with regular assessment of quality issues for the MIP relevant data and continuous improvement of methodology and basic information.

For example, the inclusion of Census-2011 results is an important source of improved population estimates and it will potentially lead to revisions for unemployment data in a number of Member States. The Census results might also affect the indicator on Unit Labour Cost if the corresponding employment figures are changed.

The general frameworks for the compilation of MIP relevant statistics will undergo changes in 2014 with the introduction of new manuals for national accounts (ESA 2010 replacing ESA 95) and balance of payments (BPM6 replacing BPM5). This is the results of several years of work by statisticians. It will also open up for new and relevant macroeconomic data available at the end of 2014. Most Member States will at the same time update their production systems for national accounts and balance of payment. The combined effect of methodological changes and improved production systems may lead to further revisions of data towards the end of 2014.

Source: EUROSTAT, DG ECFIN (for the indicators on the REER).

Note: (1) Eurostat estimate based on HPI data from Bank of Greece produced in agreement with ELSTAT. (2) HPI data up until 2011 by Statistics Austria. For 2012, Eurostat estimates a deflated rate of 9.6% based on non-harmonised HPI data by ECB & Central Bank of Austria. (3) Eurostat expressed a reservation on Austrian general government sector debt, see Eurostat press release 152/2013. (4) p= provisional data, e= estimated.

Table 1.2: MIP scoreboard 2011

Year 2011	External Imbalances and Competitiveness									Internal Imbalances

Note: The balance of payments is the statistical statement that systematically summarises, for a specific time period, the economic transactions of an economy with the rest of the world. The balance of payments is broken down into three broad sub-balances: the current account, the capital account, and the financial account. Current account is the major driver of net lending/net borrowing of an economy; it provides important information about the economic relations of a country with the rest of the world. It covers all transactions (other than those in financial items) that involve economic values and occur between resident and non-resident units. The MIP indicator is calculated as the three years backward moving average. The indicator is based on the balance of payments data reported to Eurostat by EU Member States. Definitions are based on the IMF's Fifth Balance of Payments Manual (BPM5).

Source: EUROSTAT.

Note: International investment position (IIP) statistics record the net financial position (assets minus liabilities) of a country vis-à-vis the rest of the world. Data cover stocks of direct and portfolio investments, financial derivatives and other investment and reserve assets. If the net IIP is very negative, the domestic sectors of the economy are indebted toward the rest of the world. The net IIP is the stock counterpart to the current plus capital account balance and therefore allows for a stock-flow analysis of external positions. The IIP data are based on the Balance of Payments information (Regulation n°184/2005) and are compiled in accordance with the guidelines on the statistical reporting requirements of the European Central Bank (ECB) - European Union Balance of Payments/International Investment Position Statistical Methods of May 2007. The IIP indicator is expressed as total net international investment position at end of the year in percentage of GDP.

Note: The REER (or Relative price and cost indicators) aim to assess a country's price or cost competitiveness relative to its principal competitors in international markets. Changes in cost and price competitiveness depend not only on exchange rate movements but also on cost and price trends. The specific REER for the Macroeconomic Imbalances Procedure is deflated by the consumer price indices relative to a panel of 42 countries (Double export weights are used to calculate REERs, reflecting not only competition in the home markets of the various competitors, but also competition in export markets elsewhere). A rise in the index means a loss of competitiveness. The MIP indicator is expressed as the percentage change over three years. Data source: Directorate General for Economic and Financial Affairs (DG ECFIN).

Note: Nominal unit labour cost compares remuneration (compensation per employee) and productivity (gross domestic product (GDP) per employment) to show how the remuneration of employees is related to the productivity of labour. The employment data covers both employees and self-employed while remuneration covers wages and salaries and employers' social contributions. The unit labour cost indicator is compiled using national accounts data, see ESA95 transmission programme. The MIP indicator is expressed as the percentage change over three years.

Note: Nominal unit labour cost compares remuneration (compensation per employee) and productivity (gross domestic product (GDP) per employment) to show how the remuneration of employees is related to the productivity of labour. The employment data covers both employees and self-employed while remuneration covers wages and salaries and employers' social contributions. The unit labour cost indicator is compiled using national accounts data, see ESA95 transmission programme. The MIP indicator is expressed as the percentage change over one year.

Note: (1) For the Macroeconomic Imbalances Procedure, house prices developments are measured as the evolution of prices in the house market relative to the evolution of the national accounts deflator for final consumption expenditure of households and non-profit institutions serving households (ESA 2010). A positive value means that house prices grow faster than consumer prices. Eurostat House Price Index (HPI) captures price changes of all residential properties purchased by households (flats, detached houses, terraced houses, etc.), both new and existing, independently of their final use and their previous owners. Only market prices are considered, self-build dwellings are therefore excluded. The land component is included. The MIP indicator is expressed as year on year change. (2) Eurostat estimate based on HPI data from Bank of Greece produced in agreement with ELSTAT. (3) HPI data up until 2011 by Statistics Austria. For 2012, Eurostat estimates a deflated rate of 9.6% based on non-harmonised HPI data by ECB & Central Bank of Austria. (4) b= break in time series, p= provisional data, e= estimated.

Note: (1) The private sector credit flow represents the net amount of liabilities in which the sectors Non-Financial corporations (S.11) and Households and Non-Profit institutions serving households S.14_S.15) have incurred along the year. The instruments that are taken into account to compile private sector credit flow are Securities other than shares, excluding financial derivatives, (F.33) and Loans (F.4), that is, no other instruments are added to calculate the private sector credit flow. Definitions regarding sectors and instruments are based on the ESA 95. Data are presented in consolidated terms, i.e. data do not take into account transactions within the same sector. The MIP indicator is expressed as percentage of GDP. (2) p= provisional data.

Note: (1) General government debt is defined in the Maastricht Treaty as consolidated general government gross debt at nominal value, outstanding at the end of the year. The general government sector comprises central government, state government, local government, and social security funds. The relevant definitions are provided in Council Regulation (EC) N° 479/2009 as amended by Council Regulation 679/2010. Data for the general government sector are consolidated between sub-sectors at the national level. Differences between the EDP debt and MIP debt may arise as a result of different timetables for the updating of GDP figures. The MIP indicator is expressed as percentage of GDP. (2) AT, Eurostat expressed a reservation on Austrian general government sector debt, see Eurostat press release 152/2013.

Note: (1) The unemployment rate is the number of unemployed persons as a percentage of the labour force based on International Labour Office (ILO) definition. The labour force is the total number of people employed and unemployed. Unemployed persons comprise persons aged 15 to 74 who: - are without work during the reference week; - are available to start work within the next two weeks; - and have been actively seeking work in the past four weeks or had already found a job to start within the next three months. The principal legislation is the Council Regulation (EC) No 577/98 on the organisation of a labour force sample survey in the Community. In order to ensure consistent time series, Eurostat amends the series for possible breaks due to improvements in labour force survey methodology or sample design. The MIP indicator is the average of the unemployment rate for the past three years. (2) Revisions for IE, LT, LV, PL are also due to the inclusion of the latest census results in the weighting of the LFS.

Note: Gross domestic product (GDP) is a measure of the economic activity, defined as the value of all goods and services produced less the value of any goods or services used in their creation. The calculation of the annual growth rate of GDP volume is intended to allow comparisons of the dynamics of economic development both over time and between economies of different sizes. For measuring the growth rate of GDP in terms of volumes, the GDP at current prices are valued in the prices of the previous year and the thus computed volume changes are imposed on the level of a reference year; this is called a chain-linked series. Accordingly, price movements will not inflate the growth rate. Data are expressed as percentage change comparing year Y with year Y-1.

Note: Gross fixed capital formation (GFCF, ESA 1995, 3.102) consists of resident producers' acquisitions, less disposals, of fixed assets during a given period plus certain additions to the value of non-produced assets realised by the productive activity of producer or institutional units. GFCF includes acquisition less disposals of, e.g. buildings, structures, machinery and equipment, mineral exploration, computer software, literary or artistic originals and major improvements to land such as the clearance of forests. Data are expressed as percentage of GDP.

Note: Net lending/borrowing of a country corresponds to the sum of total current and capital accounts' net transactions in balance of payments. The balance of payments is the statistical statement that systematically summarises, for a specific time period, the economic transactions of an economy with the rest of the world. The balance of payments is broken down into three broad sub-balances: the current account, the capital account, and the financial account. The positive value of net lending/borrowing indicator means that the country is creditor, while negative value means that it is the debtor to rest of the world. The MIP indicator is expressed as percentage of GDP. The indicator is based on the balance of payments data reported to Eurostat by EU Member States. Definitions are based on the IMF's Fifth Balance of Payments Manual (BPM5).

Note: The net external debt is calculated by subtracting the gross external debt assets from the liabilities. It represents difference between the outstanding amounts of actual (i.e. non-contingent) current liabilities and assets that require payment of principal and/or interest to non-residents at some point in the future. These liabilities/assets include debt securities, such as bonds, notes and money market instruments, as well as loans, deposits, currency, trade credits and advances due to non-residents. The debt may be issued with different maturity profiles by the general government, banks, and other sectors. GDP (gross domestic product) is an indicator for a nation's economic situation. It reflects the total value of all goods and services produced less the value of goods and services used for intermediate consumption in their production. Data are expressed as percentage of net external debt position in relation to GDP.

Note: Foreign direct investment (FDI) is the category of international investment made by an entity resident in an economy (direct investor) to acquire a lasting interest in an entity operating in an economy other than that of the investor (direct investment enterprise). The lasting interest is deemed to exist if the investor acquires at least 10% of voting power of the direct investment enterprise. Inward FDI flows are the net value of FDI from all countries of the world at the end of the reference period in the reporting economy. Data are expressed as percentage of GDP to remove the effect of differences in the size of the economies of the reporting countries.

Note: Foreign direct investment (FDI) is the category of international investment made by an entity resident in an economy (direct investor) to acquire a lasting interest in an entity operating in an economy other than that of the investor (direct investment enterprise). The lasting interest is deemed to exist if the investor acquires at least 10% of the voting power of the direct investment enterprise. Inward FDI stocks are the value of FDI liabilities from all countries of the world at the end of the reference period in the reporting economy. Data are expressed as percentage of GDP to remove the effect of differences in the size of the economies of the reporting countries.

Note: The net trade balance of energy products is calculated, for each Member State, as the difference between exports to and imports from the rest of the world (intra-EU and extra-EU trade) of goods included in the SITC section 3 - Mineral fuels, lubricants and related materials. The indicator is expressed as % of GDP.

Note: The REER (or Relative price and cost indicators) aim to assess a country's price or cost competitiveness relative to its principal competitors in international markets. Changes in cost and price competitiveness depend not only on exchange rate movements but also on cost and price trends. The specific REER for the Macroeconomic Imbalances Procedure is deflated by the consumer price indices relative to relative to the panel of euro area Member States. Double export weights are used to calculate REERs, reflecting not only competition in the home markets of the various competitors, but also competition in export markets elsewhere. A rise in the index means a loss of competitiveness. The MIP indicator is expressed as the percentage change over three years. Data source: Directorate General for Economic and Financial Affairs (DG ECFIN).

Note: The terms of trade are a measure of a country's trade competitiveness since they indicate how much imports an economy can get for a unit of export goods. They are calculated as the ratio of the price index for exports of goods and services to the price index for imports of goods and services. These are obtained by dividing current prices by chain-linked volumes using the standard reference year 2005. The indicator refers to the percentage change over 5 years, i.e. data are expressed as percentage change comparing year Y with the year Y - 5.

Source: EUROSTAT.

Note: The exports performance indicator shows developments in shares of exports of goods and services of EU Member States in relation to total exports of goods and services of 34 OECD countries. Data on the values of exports of goods and services are compiled as part of the balance of payments of each country. To capture the structural losses in competitiveness that can accumulate over longer time periods, the indicator is calculated comparing year Y with year Y-5. Exports of goods and services of OECD countries are calculated as sum of exports of 34 countries (21 EU MSs and 13 non-EU countries). The indicator is based on the balance of payments data reported to Eurostat by the EU Member States, Iceland, Norway and Turkey. Source of data for other non-EU countries is OECD and IMF.

The percent change of volume of exports refers to the aggregate change in the quantities of total exports whose characteristics are unchanged. The goods and services and their prices are held constant, therefore changes are due to changes in quantities only. The MIP indicator is expressed as percentage change comparing year Y with year Y-1.

Note: Labour Productivity expresses Gross domestic product (GDP) per person employed, where GDP is a measure of the economic activity defined as the value of all goods and services produced less the value of any goods or services used in their creation. GDP per person employed is intended to give an overall impression of the productivity of national economies. Basic figures are expressed in PPS, i.e. a common currency that eliminates the differences in price levels between countries allowing meaningful volume comparisons of GDP between countries. Please note that "persons employed" does not distinguish between full-time and part-time employment. The MIP indicator is expressed as percentage change comparing year Y with year Y-1.

Note: Nominal unit labour cost compares remuneration (compensation per employee) and productivity (gross domestic product (GDP) per employment) to show how the remuneration of employees is related to the productivity of labour. The employment data covers both employees and self-employed while remuneration covers wages and salaries and employers' social contributions. The unit labour cost indicator is compiled using national accounts data, see ESA95 transmission programme. The MIP indicator is expressed as percentage change of indexes comparing year Y with year Y-10.

ULC performance relative to the euro area aims to assess the Unit Labour Costs (ULC) developments for each country against ULC of the (other) euro area Member States. Double export weights are used in the calculation (same weights as used in the REER calculations), reflecting the relative significance of each trading partner: not only competition in the home markets of the various competitors is taken account of, but also competition in export markets elsewhere. The MIP indicator is expressed as percentage change of indexes comparing year Y with year Y-10.

Note: (1) The House Price Index captures price changes of all residential properties purchased by households (flats, detached houses, terraced houses, etc.), both new and existing, independently of their final use and their previous owners. Only market prices are considered, self-build dwellings are therefore excluded. The land component is included. The MIP indicator is expressed as the percentage change over three years.

(2) Eurostat estimate based on HPI data from Bank of Greece produced in agreement with ELSTAT.

Note: Residential Construction consists of the part of Gross fixed capital formation (GFCF, ESA 1995, 3.102) for the dwellings asset. GFCF consists of resident producers' acquisitions, less disposals, of fixed assets during a given period plus certain additions to the value of non-produced assets realised by the productive activity of producer or institutional units. Data are expressed as percentage of GDP.

Note: (1) The private sector debt is the stock of liabilities held by the sectors Non-Financial corporations (S.11) and Households and Non-Profit institutions serving households (S.14_S.15). The instruments that are taken into account to compile private sector debt are Securities other than shares, excluding financial derivatives, (F.33) and Loans (F.4), that is, no other instruments are added to calculate the private sector debt. Definitions regarding sectors and instruments are based on the ESA 95. Data are presented in non-consolidated terms, i.e. taking into account transactions within the same sector. (2) p= provisional data.

Note: Employment consists of both employees and self-employed, who are engaged in some productive activity that falls within the production boundary of the system (ESA 95, 11.11). Employment covers employees and self-employed working for production units resident on the economic territory (i.e. the domestic employment concept). Employment is measured in number of persons without distinction according to full-time or part-time work. Data are compiled according to the Statistical classification of economic activities in the European Community, (NACE Rev. 2). Data are expressed as percentage change comparing year Y with year Y-1.

Note: The activity rate is the percentage of economically active population aged 15-64 years on the total population of the same age. The active population comprises employed and unemployed persons. Employed persons are those who either worked for at least one hour for pay or profit or family gain during the reference week or were not at work but had a job or business from which they were temporarily absent, for example because of holidays or illness. Unemployed persons are those who (1) were not employed according to the definition above; (2) were available to start work within the next two weeks; (3) have actively sought employment at some time during the previous four weeks. This indicator is based on EU Labour Force Survey results. The EU LFS covers the resident population in private households

Note: The long-term unemployment rate expresses the number of long-term unemployed aged 15-74 as a percentage of the active population of the same age. Long-term unemployed are those unemployed persons who were looking for work for at least 12 months. Unemployed persons are those who (1) were not employed according to the definition above; (2) were available to start work within the next two weeks; (3) have actively sought employment at some time during the previous four weeks. The active population is the sum of employed and unemployed persons. This indicator is based on EU Labour Force Survey results. The EU LFS covers the resident population in private households.

Note: The indicator young people neither in employment nor in education and training (NEET) provides information on young people aged 15 to 24 who meet the following two conditions: (a) they are not employed (i.e. unemployed or inactive according to the International Labour Organisation definition) and (b) they have not received any education or training in the four weeks preceding the survey. Data are expressed as a percentage of the total population in the same age group and sex, excluding the respondents who have not answered the question 'participation to education and training'. Data are based on the European Union Labour Force Survey results.

Source: EUROSTAT.

Note: (1) This indicator corresponds to the sum of persons who are: at risk of poverty or severely materially deprived or living in households with very low work intensity. Persons are only counted once even if they are present in several sub-indicators. At risk-of-poverty are persons with an equivalised disposable income below the risk-of-poverty threshold which is set at 60% of the national median equivalised disposable income (after social transfers). Material deprivation covers nine items relating to the economic strain and durables of a household. People severely materially deprived are those with an enforced lack of at list four of these items. People living in households with very low work intensity are those aged 0-59 living in households where the adults (aged 18-59) worked less than 20% of their total work potential during the past year. Students are excluded. Data are expressed in % of total population. (2) 2012 data for BE, IE, AT, UK, official transmission deadline for 2012 data is 30 November 2013 while data were extracted on 1st of November 2013". (3) p= provisional data.
